Slot: B

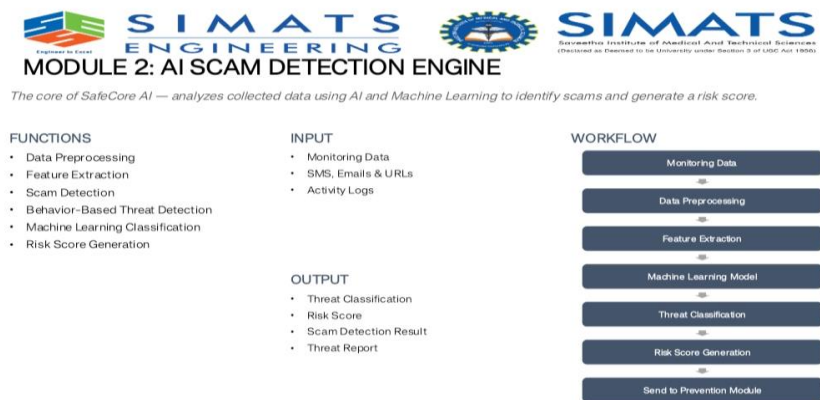

Course Name: OPERATING SYSTEM

Course Faculty: DR.candravathi

Project Title:

Safecore AI:Real-Time Scam Detection System

Module Photographs: (3 photographs –Module Photo, Individual student contribution module work in the project and presentation image)

Project Description:

SafeCore AI: Real-Time Scam Detection System is an AI and Machine Learning-based system designed to detect scams and suspicious activities in real time. It collects monitoring data such as SMS, emails, URLs, and user activity logs and processes the data to remove unnecessary or irrelevant information. The system then performs feature extraction to identify important scam indicators such as suspicious keywords, harmful links, unusual messages, and abnormal user behavior. These features are analyzed by a Machine Learning model to classify the activity as safe or potentially fraudulent. SafeCore AI generates a threat classification, risk score, scam detection result, and threat report based on the analysis. The risk score helps determine the severity of the threat, such as low, medium, high, or critical. Finally, the detected information is sent to the prevention module, which can warn the user or take appropriate security actions. Overall, SafeCore AI provides a fast, intelligent, and proactive approach to detecting scams and protecting users from phishing, fraud, and other cyber threats.
